

Neuro DataLab

Neuro DataLab is a research group focused on understanding the neural basis of human decision-making and learning. We use a combination of computational modeling, neuroimaging, and behavioral experiments to study how the brain processes information and makes decisions.

Our research interests include the neural basis of decision-making, learning, and memory. We are particularly interested in understanding how the brain represents and processes information about the environment and how this information is used to make decisions.

We are currently studying the neural basis of decision-making in a variety of contexts, including the role of the prefrontal cortex, the role of the striatum, and the role of the hippocampus. We are also studying the neural basis of learning and memory, and how these processes are related to decision-making.

Our research is supported by a variety of funding sources, including the National Institutes of Health, the National Science Foundation, and the National Defense Science and Engineering Graduate Fellowship. We are grateful to our funding sources for their support of our research.

We are currently looking for graduate students and postdoctoral fellows to join our research group. If you are interested in pursuing a PhD or postdoc in neuroscience, and you have a strong background in computational modeling, neuroimaging, and behavioral experiments, we would be happy to consider you for our research group.

For more information about our research group, please visit our website at neurodatalab.org. We are also happy to answer any questions you may have about our research or about applying to our research group.
